

第五次作业

任俊屹, PB16070892, [github](#)

- 1 用 interface 定义出一个新的虚拟函数 Area, 当调用 area 只输入一个浮点数时, 把他当成是圆的半径值, 计算并返回圆的面积。当输入两个浮点数时, 把他们当成是矩形的两个边长, 并返回矩形的面积。

直接计算。测试程序输出 area(5.) 和 area(3., 4.) 的值。代码如下:

[area.f90](#)

```
1 module area_module
2     implicit none
3     interface area
4     module procedure area_circle, area_rectangle
5     end interface
6
7     contains
8         function area_circle(r)
9             !Calculate area of a circle, if one arg recieved.
10            Real :: area_circle, r
11            area_circle = 3.14159265358979 * r**2
12        end function area_circle
13
14        function area_rectangle(a, b)
15            !Calculate area of a rectangle, if two args recieved.
16            Real :: area_rectangle, a, b
17            area_rectangle = a * b
18        end function area_rectangle
19    end module area_module
```

测试代码如下:

[test.f90](#)

```
1 program main
2     !Just a test program, print results calling functing "area".
3     use area_module
4     write(*, *) "Value of 'area(5.)': ", area(5.)
5     write(*, *) "Value of 'area(3., 4.)': ", area(3., 4.)
6 end program
```

无输入文件，输出文件为[output.txt](#)

2 用 Lax-Wendroff 格式编写程序求解 Burgers 方程，并分析 CFL（柯朗数）对计算的影响。

对于非线性方程

$$\frac{\partial u(x,t)}{\partial t} + \frac{\partial f(u(x,t))}{\partial x} = 0$$

Lax-Wendroff 格式的表达式为：

$$u_i^{n+1} = u_i^n - \frac{\Delta t}{2\Delta x} [f(u_{i+1}^n) - f(u_{i-1}^n)] + \frac{\Delta t^2}{2\Delta x^2} [A_{i+1/2}(f(u_{i+1}^n) - f(u_i^n)) - A_{i-1/2}(f(u_i^n) - f(u_{i-1}^n))]$$

式中， $A_{i\pm 1/2}$ 的值为 $\frac{1}{2}(u_i^n + u_{i\pm 1}^n)$ 。本例中，

$$f(u) = \frac{1}{2}u^2$$

全局定义代码：

[global.f90](#)

```

1 module Global
2     implicit none
3     !Scale and output info
4     Integer, parameter :: nx = 101, ntend = 4
5     !Grid
6     Real, parameter :: x_range(2) = (/ -2., 14./), &
7         dx = (x_range(2) - x_range(1))/(nx-1)
8     !Times to output
9     Real, parameter :: tend(ntend) = (/ 1., 2., 3., 4./)
10
11     !Global variables
12     Real*4, save :: t, u(nx), x(nx), dt, s=1., CFL=0.1
13     !$omp threadprivate(t, u, x, dt, s, CFL)
14 end module Global

```

计算代码：

[routines.f90](#)

```

1 module Routines
2     !This module defines init operation and step operation.
3     use Global
4     implicit none
5     contains
6
7     subroutine init
8         implicit none
9         Integer i
10        forall (i = 1:nx)

```

```

11         x(i) = (i - 1) * dx + x_range(1)
12     end forall
13     u = 1.5 + s * tanh(x)
14     t = 0
15 end subroutine init
16
17 subroutine next_LW
18     !Lax-Wendroff method.
19     !Calling this subroutine will make the module step forward.
20     implicit none
21     Real, save :: u_t(0:nx+1), a_t(1:nx+1)
22     !$omp threadprivate(u_t, a_t)
23     u_t(1:nx) = u
24     u_t(0) = 1.5 + s * tanh(x_range(1))
25     u_t(nx+1) = 1.5 + s * tanh(x_range(2))
26
27     a_t = 1/2. * (u_t(0:nx) + u_t(1:nx+1))
28
29     dt = CFL * dx / maxval(abs(a_t))
30
31     u = u - dt/(4*dx) * (u_t(2:nx+1)**2 - u_t(0:nx-1)**2) + &
32         1/4.*(dt/dx)**2 * (a_t(2:nx+1)*(u_t(2:nx+1)**2-u_t(1:nx)**2) - &
33             a_t(1:nx)*(u_t(1:nx)**2-u_t(0:nx-1)**2))
34     t = t + dt
35 end subroutine next_LW
36
37 end module Routines

```

非并行测试代码:

[main.f90](#)

```

1 program main
2     !One thread test, use s = 1 as default
3     use Global
4     use Routines
5     implicit none
6     Integer :: i
7
8     open(10, file='LW.dat', form='unformatted', status='replace')
9
10    call init
11    write(10) t, u

```

```

12
13     do i = 1, ntend
14         do while(t < tend(i))
15             call next_LW
16         end do
17         write(10) t, u
18     end do
19
20     close(10)
21 end program

```

并行测试代码，包括 $s = \pm 1$:

[parallel.f90](#)

```

1 program main
2     !Parallel test. Use s = 1 and s = -1.
3     !Output to parallel0.dat to parallel3.dat
4     use Global
5     use Routines
6     implicit none
7     Integer :: i, j
8     Character :: filename
9
10    !$omp parallel do private(j, filename)
11    do i = 0, 3
12        write(filename, '(i1)') i
13        select case(i)
14            case(0)
15                s = 1
16            case(1)
17                s = -1
18            case(2)
19                s = 1
20                CFL = 0.5
21            case(3)
22                s = 1
23                CFL = 2
24        end select
25        call init
26        open(10+i, file='parallel'//filename//'.dat', &
27            status='replace', form='unformatted')
28        write(10+i) t, u

```

```

29
30         do j = 1, ntend
31             do while(t < tend(j))
32                 call next_LW
33             end do
34             write(10+i) t, u
35         end do
36
37         close(10+i)
38     end do
39     !$omp end parallel do
40
41 end program

```

绘图代码:

[draw.py](#)

```

1  #!/usr/bin/python3
2  import numpy as np
3  from scipy.io import FortranFile
4  import matplotlib.pyplot as plt
5  import sys
6
7  #Get data file name from shell
8  f = FortranFile(sys.argv[1], 'r')
9  x = np.linspace(-2, 14, 101)
10
11 lines = []
12 labels = []
13
14 #Read file and draw
15 while True:
16     try:
17         data = f.read_reals(dtype=np.float32)
18     except (TypeError):
19         break
20     labels.append('t = ' + str(data[0]))
21     l, = plt.plot(x, data[1:], lw=1)
22     lines.append(l)
23
24 #Set picture style
25 plt.xlabel('x')

```

```

26 plt.ylabel('u')
27 plt.xlim(x.min(), x.max())
28 plt.legend(handles=lines, labels=labels)
29 plt.minorticks_on()
30 plt.tick_params(which='both', top=True, right=True)
31 plt.tick_params(which='both', direction='in')
32 #Save picture as eps file
33 plt.savefig(sys.argv[1][: -4] + '.eps', format='eps')

```

其中，并行测试部分的第一个输出与非并行部分相同，以下插图不再重复。 $s = 1, CFL = 0.1$:

[parallel0.eps](#)

$s = -1, CFL = 0.1$:

[parallel1.eps](#)

$s = 1, CFL = 0.5$:

[parallel2.eps](#)

$s = 1, CFL = 2$:

[parallel3.eps](#)

非并程序的输出文件为[LW.dat](#),相应图像为[LW.eps](#)。并程序的输出文件为[parallel0.dat](#)和[parallel1.dat](#)。
CFL 较大时,会导致计算结果不稳定。

3 用蛙跳格式编写程序求解扩散方程,并分析 CFL(柯朗数)对计算的影响。

套入格式直接计算即可。由于该隐式格式简单,可以直接转换为显示格式计算,即:

$$u_i^{n+1} = (u_i^{n-1} + \frac{2b\Delta t}{\Delta x^2}(u_{i+1}^n - u_i^{n-1} + u_{i-1}^n)) / (1 + \frac{2b\Delta t}{\Delta x^2})$$

全局定义代码:

[global.f90](#)

```
1 module Global
2   implicit none
3   Integer, parameter :: nx = 101, ntend = 4
4   Real, parameter :: x_range(2) = (/ -2., 2./), tend(ntend) = (/ 1., 2., 3., 4./)
5   Real, parameter :: b = 0.01, dx = (x_range(2) - x_range(1)) / (nx-1)
6   !u_last storing u's value in last step for calculating u_next
7   Real, save :: x(nx), t, dt, u(nx), u_last(nx), u_next(nx), CFL=0.1
8   !$omp threadprivate(x, t, dt, u, u_last, u_next, CFL)
9 end module Global
```

计算代码:

[routines.f90](#)

```
1 module Routines
2   use Global
3   implicit none
4   contains
```

```

5
6      !Initialize everything to default value.
7      subroutine init
8          implicit none
9          Integer :: i
10         forall (i = 1:nx)
11             x(i) = (i-1) * dx + x_range(1)
12         end forall
13         u = exp(-(x/0.1)**2)
14         u_last = u
15         u_next = u
16         t = 0
17     end subroutine init
18
19     !Use when need different u.
20     subroutine init_without_u
21         implicit none
22         Integer :: i
23         forall (i = 1:nx)
24             x(i) = (i-1) * dx + x_range(1)
25         end forall
26         t = 0
27     end subroutine init_without_u
28
29     !Let u_last and u_next equals to u. Call when u is envalued.
30     subroutine init_u
31         implicit none
32         u_last = u
33         u_next = u
34     end subroutine init_u
35
36     subroutine next
37         implicit none
38         Real, save :: u_t(0:nx+1), alpha
39         !$omp threadprivate(u_t, alpha)
40
41         dt = dx*CFL/maxval(abs(u))
42         u_t(1:nx) = u
43         u_t(0) = 0
44         u_t(nx+1) = 0
45

```

```

46         alpha = 2*b*dt/dx**2
47
48         u_next = (u + alpha*(u_t(2:nx+1) - u_last + u_t(0:nx-1)))/(1+alpha)
49         u_last = u
50         u = u_next
51         t = t + dt
52     end subroutine next
53 end module Routines

```

非并行测试代码:

[main.f90](#)

```

1 program main
2     !One thread case.
3     use Global
4     use Routines
5     implicit none
6     Integer i
7
8     open(10, file='data.dat', form='unformatted', status='replace')
9
10    call init
11
12    write(10) t, u
13
14    do i = 1, ntend
15        do while(t < tend(i))
16            call next
17        end do
18        write(10) t, u
19    end do
20
21    close(10)
22 end program

```

并行测试代码, 包括 $s = \pm 1$:

[parallel.f90](#)

```

1 program main
2     !Two threads case.
3     !Data will be saved to parallel0.dat to parallel13.dat
4     use Global
5     use Routines

```

```

6      implicit none
7      Integer :: i, j
8      Real, parameter :: pi=3.14159265358979
9      Character :: filename
10
11      !$omp parallel do private(j, filename)
12      do i = 0, 3
13          call init_without_u
14          select case(i)
15              case(0)
16                  u = exp(-(x/0.1)**2)
17                  CFL = 0.1
18              case(1)
19                  u = exp(-(x-1)/0.1)**2 + exp(-(x+1)/0.1)**2
20                  CFL = 0.1
21              case(2)
22                  u = exp(-(x/0.1)**2)

32 plt.legend(handles=lines, labels=labels)
33 #Save picture as eps file
34 plt.savefig(sys.argv[1][: -4] + '.eps', format='eps')

```

其中，并行测试部分的第一个输出与非并行部分相同，以下插图不再重复。

单峰：

[parallel0.eps](#)

双峰:

[parallel1.eps](#)

单峰, CFL=0.5:

[parallel2.eps](#)

单峰, CFL=10:

[parallel3.eps](#)

非并行程序的输出文件为[data.dat](#),相应图像为[data.eps](#)。并行程序的输出文件为[parallel0.dat](#)和[parallel1.dat](#)。

CFL 较大时, 会导致计算结果不稳定。

4 求 $\int_0^1 \sin x dx$

用梯形法, 表示为数组形式, 代码如下:

[4.f90](#)

```
1 program main
2     implicit none
```

```

3   Real :: a, b, h, s=0.
4   Integer :: n, i
5   Real, allocatable :: x(:)
6
7   write(0, *) 'Input a, b, n'
8   read(*, *) a, b, n
9   h = (b - a)/n
10
11  allocate(x(n+1))
12  forall (i = 1:n+1)
13      x(i) = a + (i-1)*h
14  end forall
15
16  x = sin(x)
17  !Calculate with array operation.
18  s = sum(h*(x(:n)+x(2:))/2.)
19
20  write(*, 100) a, b, n
21  write(*, 200) s
22
23 100 format(1x, 'a = ', f10.3, 3x, 'b = ', f10.3, 3x, 'n=', i4)
24 200 format(1x, 's = ', f15.8)
25 end program

```

输入文件为[input.txt](#)，输出文件为[output.txt](#)。
